Municipal Advisory Board Established May 1, 2008 at the University of Texas, Arlington

MAB Basic HDPE Repair Options

(MAB-4-2023)

2nd edition re-approved as-is by MAB on April 6, 2023 at the Arlington Water Utilities, TX First edition approved at MAB 22 hosted by San Antonio Water System, TX © Plastics Pipe Institute, 2018, 2023

Effective Date: May 1, 2023

ACKNOWLEDGMENTS

The Municipal Advisory Board would like to acknowledge the excellent contributions of the MAB-4 Basic HDPE Repair Options Task Group for developing and leading this project.

Todd Grafenauer Murphy Pipelines, WI Andrew Schipper, PE City of Ft. Wayne, IN

Greg Scoby, PE City of Palo Alto, CA (past) and Crossbore Consultants, CA

MUNICIPAL ADVISORY BOARD MEMBERS

UTILITIES

Luis Aguiar Miami–Dade Water & Sewer (past), Hazen & Sawyer, FL, Co-Chair

Jessie Allen, PE Arlington Water Utilities, TX

Alan Ambler, PE City of Casselberry, FL (past), AM Trenchless, FL

FOREWORD

The MAB-4 Basic HDPE Repair Options document was developed by the Municipal Advisory Board (MAB) and published with the help of the members of the Plastics Pipe Institute, Inc. (PPI).

The MAB-4 Basic HDPE Repair Options is intended as a guide for engineers, users, contractors, code officials, and other interested parties for use in the repair of high density polyethylene (HDPE) pressure water piping systems. The local utility or engineer may need to modify the document to adapt to local conditions, operations, and practices.

The MAB-4 Basic HDPE Repair Options were prepared by MAB members and associates as a service to the water industry. The information in this document is offered in good faith and believed to be accurate at the time of its preparation, but is offered "as is" without express or implied warranties, including WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. Any reference to a specific manufacturer's product is merely illustrative, and not intended as an endorsement of that product. Reference to or testing of a proprietary product should not be construed as an endorsement by the MAB or PPI, which do not endorse the proprietary products or processes of any manufacturer. Users are advised to consult the manufacturer for more detailed information about the specific manufacturer's products. The information in this document is offered for consideration by industry members in fulfilling their own compliance responsibilities. MAB and the PPI assume no responsibility for compliance with applicable laws and regulations.

The MAB serves as an independent, non-commercial adviser to the Municipal & Industrial (M & I) Division of the PPI. Once adopted, MAB will consider revising this document from time to time, in response to comments and suggestions from users. Please send suggestions of improvements to Camille George Rubeiz, PE, F.ASCE, at *crubeiz@plasticpipe.org*.

RECOMMENDATIONS

- 1. If you are able to eliminate water through the pipe, then fusion should be the first choice of repair.
- 2. Squeeze off tools can create dry conditions for fusion.
- All mechanical couplings should include pull out resistance/restraint or be used with external restraint clamps when using non-restraint mechanical couplings.
- 4. Internal stiffeners should be used for all mechanical couplings.
- 5. Corrosion protection should be provided for all underground metallic fittings.
- 6. Fabricated fittings should always be at least one SDR thicker than pipe and have the same Pressure Rating as the pipeline.
- 7. Illustrations for repair with fabricated fittings are appropriate for molded fittings.
- 8. For mechanical connections, contact the fitting manufacturer to verify that these connections are designed to work specifically with HDPE.

ELECTROFUSION REPAIR OF LEAKING SADDLE FUSIONS:

Leaks due to suspect electrofusion saddle joints can be repaired by removing the leaking connection and replacing the saddle. A weak or leaking fusion is likely due to contamination in the fusion zone or the lack of pipe preparation at the time of initial installation. In such cases, the saddle can be removed by re-energizing the heating coil to the point that the PE material becomes melted and softened. Once re-melted, the old saddle can be pulled from the pipe and a new saddle can be installed in the same location.

PROCEDURE:

Excavate to expose the suspect saddle and depressurize the system. Disconnect the service line and clean the pipe surfaces immediately surrounding the suspect saddle.

If the saddle has a "permanent" clamping device, such as a bolt-on strap or plastic underpart, the clamp must be removed. Connect the electrofusion control box to the suspect saddle and start the fusion cycle.

When the fusion cycle is complete, immediately pull the saddle from the pipe. Wear gloves and use caution to avoid burns from hot plastic or wires. Small tapping saddles can normally be removed by hand, but if necessary a suitable rubber mallet may be used to strike the fitting.

Inspect the pipe surface for damage. Remnants of PE material from the saddle will likely remain on the pipe surface and can be removed with a rasp to re-shape the pipe curvature. Once the remnants are removed, the pipe can be prepared for fusion by peeling/scraping using approved procedures. The tap hole may require that the peeler blade be manipulated to allow it to pass over the hole in the pipe as it revolves over that area.

Place the new fitting over the tap hole carefully to ensure that the hole is inside of the fusion zone boundary. A mandrel or guide may be inserted into the tap hole to aid in aligning the replacement fitting over the hole. Clamp the fitting in place and fuse per normal procedures.

Allow the fitting to cool per normal procedures prior to removing the clamp, reconnecting the service line, and returning to service.
